

Suction mouth

New

Egholm has developed a new suction mouth for the suction sweeper of the City Ranger 2260

Maximum efficiency

New suction nozzle with minimum risk of clogging and with maximum vacuum

Benefits of the new suction mouth:

- Increased productivity - branches, leaves and large objects will pass easier through the hose to the hopper tank.
- The centre brush is removed so you will avoid replacing it after wear, and with that save operating costs.
- Small stones are collected more easily.
- A new closing system ensures a larger vacuum thus greater suction power, which makes it easier to collect objects.
- Updated product at the same price, where the user saves money in the long run, due to lower maintenance and operating costs.

Suction mouth kit without center brush:

(item no. E80700389)

Suction mouth adjustment

The suction mouth can be adjusted so it is closer to the brushes if there is a need for it over time. This ensures optimal collection when turning the machine. The adjustment is made by pulling out the button with which the suction mouth can be moved forwards or backwards.

Possibilities of options

If you have an existing suction sweeper with center brush and would like to update to the new version without center brush, an optional kit makes it possible for you to mount the new suction nozzle on the existing front brush units.
